

Main menu inputs of program work, but doesn't properly verify the inputs of accountnumber. Input such as \$\$\$, asd, and poq99 will add a record with the account number 32579. Other functionality of add record including name and address seem to be functioning properly, Print record verifies input properly for integer and non integer input, but doesn't check if there is a space in between integers. It will print a record if the integer up until the space exists. Print all records works as expected in the menu. Delete record verifies input as expected not taking non integer input as an account number. Most invalid input in the main user interface is verified except for when user inputs strings with spaces.
